

NEW ZEEBRIES...

...NON-EXCLUSIVE 3D SEISMIC SURVEY

Fugro has acquired new 3D seismic data in the Carnarvon Basin. The Zeebries survey consists of ~3,800 km² and covers part of the Exmouth Plateau and Beagle Sub-Basin.

The survey aim is to clearly define play levels under the Muderong Shale formation including the Triassic Mungaroo fault block plays in the central part of the survey area (on trend with the Goodwyn and Perseus gas field to the south) and Jurassic–Triassic horsts and wrench-controlled troughs to the east in WA-418-P.
